

GREEN NEEDLEGRASS

Nassella viridula

ABOUT GREEN NEEDLEGRASS

Green needlegrass is a great option for a resilient, drought hardy, tall grass, especially if you like the look of Karl Forrester grass but want a native option.

Adding this grass to your garden helps pollinators thrive and provide visual interest throughout all seasons.

This species spreads readily through seeds which can be collected in June or July.

CARE INSTRUCTIONS

- Caring for me is easy! After transplanting me into your garden, water me right away, daily for the first 3 days then weekly or if I'm looking sad!
- Once established, I don't require a lot of water. If I'm planted in a space where there's snow cover, the spring melt should be sufficient for new growth each year.
- If I'm looking a little sad or wilted, or the space I'm in doesn't get snow, give me enough water to soak my root ball to perk me up.

Blooms during:
